New recombinant adenovirus comprising an adenovirus that encodes one or more AAV REP78/68 polypeptides that are inducibly expressed, useful as a vector for gene therapy.

Example; Page 120; 122pp; English.

The invention relates to a recombinant adenovirus comprising an adenovirus that encodes one or more AAV REP78/68 polypeptides that are inducibly expressed. A complete virus-mediated system for recombinant AAV production is provided which comprises: (a) a first recombinant adenovirus encoding one or more AAV REP78/68 polypeptides and one or more AAV REP78/68 polypeptides and one or more a gene of interest and AAV inverted terminal repeats that flank the gene of interest; (c) vital helper functions; and (d) a host cell comprising the first recombinant adenovirus, the second recombinant adenovirus, and the vital helper functions. The recombinant adenovirus, and the vital helper functions. The recombinant AAV is useful as a vector for gene therapy. The present sequence represents an AAV-2 right inverted terminal repeat (ITR) sequence

```
inverted terminal repeats. The vector is safe for use in gene therapy, partic. in treatment of haemoglobinopathies and a variety of diseases, e.g. thalassemia, diabetes, sickle cell anaemia, and cancer. See also AAQ41449. (Updated on 25-MAR-2003 to correct PN field.)

The viruses pref. contain at least one inverted terminal repeat (ITR) sequence and in particular two ITRs flank an eterologous DNA insert. The present sequence is that of the strict ITR from adeno associated virus AAV-2 (i.e. the ITR sequence without any deletions or additions). In the construct pITRFL, the beta-galactosidase marker gene is flanked by two strict AAV-2 ITRs. The defective viruses are useful for stably introducing large fragments of heterologous DNA making them suitable for gene therapy. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inverted terminal repeat, ITR; adenovirus, adeno-associated virus; AAV-2; replication defective; integration; gene therapy; ds.

The present sequence is the inverted terminal repeat (ITR) from the wild type adeno associated virus (AAV) serotype 2 genome. A novel nucleic acid construct, comprises a targetting sequence capable of binding AAV Rep, or 1 the present sequence, and at least 1 heterologous nucleotide sequence arranged relative to the targetting sequence, so that it is integrated into a target site in a recipient genome. The integration cystem can be used to integrate a selected nucleotide sequence into a recipient cell genome, useful in the treatment of an acquired or inherited disease, e.g. long term gene therapy. The integration system can be size specific integration characteristics of AAV, is not limiting in regard to the size of the nucleotide sequences into the recipient cell genome. Specifically it can be used to safely and efficiently cell genome specifically it can be used to safely and efficiently recipient cell genome without the risk of causing insertional mutagenesis cellibration events
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

```
associated virus (AAV) vectors comprising a promoter e.g. an AAV promoter (AAX34296) and a selected DNA sequence, especially an AAV rep gene and a parvovirus B19 cap gene, located between 2 AAV inverted terminal repeats (ITR) such as the ITR sequence shown here. The system can specifically target primitive progenitor and differentiated cells of the erythroid genes. The vectors can be used for the in vitro or in vivo delivery of genes to cells such as bone marrow cells, peripheral blood cells, endothelial cells and myocardial cells
                                                                                                                                                                                                                                                                                                                                                                                          60
                                                                                                                                                                                                                                                                                                                                                                60

The invention relates to single stranded and/or looped DNA having a portion with at least one base, internally located with respect to any 3' and 5' ends of the DNA, that is unbasepaired with another base in a form that is capable of being internalised within a target cell, for use in therapy, with cytostatic and virucide activity. The DNA acts as an application in cells that lack p53 functionality, useful for application preferably a dividing cell where the cell is other than a sasociated with a solicit where the peptide or protein that selectively kills the cell. The DNA is preferably in the form of an AAV or associated with AAV protein which has been treated such that the DNA is no longer capable of replication or expression in cells and is associated with or contained within a vehicle which is associated with or contained within a vehicle which is associated cancer into a target cell. The DNA is also useful for manufacturing a medicament for treating an individual suffering from a mutant p53 associated cancer can infection that inhibits cellular b53. The method targets cancer cells infected with p53 inhibiting viruses, such as HPV16 or HPV18 and only cells that lack p53 activity are killed and no damage to cellular DNA is involved. The present sequence is that of the adenosassociated virus (AAV) 2 ITR, the double loop structure found at each end of the AAV DNA. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vector, adenovirus, adeno-associated, adenosine deaminase gene, receptor, adenosine deaminase deficiency; severe combined immune deficiency; PAH, beta-chain, haemoglobin gene, beta-thalassaemia, sickle cell disease, low density lipoprotein gene, familial hypercholesterolaemia, hypoxanthine-guanine phosphoribosyltransferase, Lesch-Nyhan syndrome; phosphoribosyltransferase, inesch-Nyhan syndrome; gene therapy; phenylketonuria, dystrophin gene; muscular dystrophy; cystic fibrosis; immunostimulant; human cystic fibrosis transmembrane conductance regulator gene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a new method of producing a vector. The method involves introducing recombinant vector having nucleotide sequence (NS) having 5' and 3' end, left and right inverted terminal repeats of adenovirus flanking NS, adenovirus packaging sequence linked to inverted terminal repeat, and adeno-associated virus terminal repeat linked to 3' end of NS, into cell expressing adenovirus early gene lacking from vector and culturing cell to produce another vector. The method is useful for generating vectors, especially mAd vectors. The method is useful in transferring nucleotide sequences of interest into a cell, for gene transfer applications (e.g. gene therapy) in vitro, ex vivo and in vivo. The nucleotide sequences are useful for treating diseases associated with it, i.e. adenosine deaminase gene associated with adenosine deaminase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             deficiency with severe combined immune deficiency, beta-chain of disease associated with beta-thalassaemia and sickle cell disease, receptor for low density lipoprotein gene associated with familial hypercholesterolaemia, hypoxanthine-guanine phosphoriansferase associated with lesch-Myhan syndrome, phosphoriansferase associated with lesch-Myhan syndrome, dystrophin gene associated with muscular dystrophy, and human cystic dibrosis. Transmenbrane conductance regulator gene associated with cystic fibrosis transmenbrane conductance regulator gene associated with cystic fibrosis. The present nucleic acid sequence represents a human adenosassociated virus 2 (AAV2) terminal repeat sequence that was used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 TIGGCCACTCCCTCTCTGCGCGCTCGCTCGCTCACTGAGGCCGGGCGACCAAAGGTCGCC 60

The present sequence is that of an adeno associated virus (AAV) palindromic inverted terminal repeat (ITR) region. An AAV ITR is used in novel insect cell-compatible vectors of the invention that are designed for the production of AAV in insect cells. The vectors comprise an AAV ITR and coding sequences for AAV VP1, VP2 and VP3 capsid proteins, for AAV non-structural replication (Rep) proteins Rep52 or Rep40, and for AAV Rep78 or Rep68. The method of producing AAV in insect cells provides an efficient, safe and economical means of producing a large amount of recombinant AAV particles which may be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     86
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             56

 The invention relates to a recombinant adenovirus comprising an adenovirus that encodes one or more AAV REP78/68 polypeptides that are inducibly expressed. A complete virus-mediated system for recombinant AAV production is provided which comprises: (a) a first recombinant adenovirus encoding one or more AAV REP78/68 polypeptides and one or more ABV REP78/68 polypeptides and one or more agene of interest and AAV inverted terminal repeats that flank the gene of interest; (c) viral helper functions; and (d) a host cell comprising the first recombinant adenovirus, the second recombinant adenovirus, and the viral helper functions. The recombinant adenovirus, and the viral helper functions. The recombinant AAV is useful as a vector for gene therapy. The present sequence represents an AAV-2 left inverted terminal repeat (ITR) sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The invention relates to identifying molecules that interact with an aden-associated viral regulatory element (e.g.a Rep recognition sequence, RSD comprising contacting at least one molecule with a nucleic sequence, RSD comprising contacting at least one molecule is bound to the viral regulatory elements. Also included is a kit for analysing the interaction between molecules and an adeno-associated viral regulatory element. The method is useful for identifying molecules e.g. at least one cellular protein, recombinant proteins, synthetic protein or exogenous protein (preferably human proteins that are derived from a cDNA library or cellular lysate), or peptide, antibody, nucleic acid, lipid, carbohydrate and/or organic or inorganic compound that interacts with an adeno-associated viral regulatory element comprising an inverted terminal repeat (ITR) or regals or the method broadens the understanding of adeno-associated virus (AAV) and facilitates the application of adeno-associated virus-based vector system, therefore ITR-binding proteins and other molecules provide new insights into the AAV life cycle, including the regulation of gene expression and integration, and suggests improvements for its application in thereapy. The present is an AAV-2 ITR containing an RRS used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identification of cellular regulations of adeno-associated virus involves contacting an adeno-associated viral regulatory interacting molecule with a nucleic acid comprising a adeno-associated viral regulatory element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *tag= f bbound molecty= "Nucleotides 41-1 of the present sequence" 33,\ .108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The 20-bp D-sequence given in AAQ66773 is present in the inverted terminal repeat (ITR) sequence of AAV and is required for viral replication. A novel, modified terminal repeat structure, double-D ITR, was constructed (AAQ66769) that contained a single 145 bp ITR sequence with an additional D' sequence. The double-D ITR fragment allows proficing including double-D ITR can be used for gene replacement therapies. (Updated on 25-MAR-2003 to correct PN field.)

                           AAD0353
                                        The adeno associated virus (AAV) has a 145 bp inverted terminal repeat (ITR) located at each end of its genome. In addition to being able to base pair with each other. The ITRs can also individually fold back on the part of the part of the ITRs can also individually fold back on the mealves through the base pairing of A, A', B, B' and C, C' sequences to form a T-shaped structure for DNA replication (See features table). It has been found that viral mutants with deleted D sequences are unable to replicate their DNA. Addition of a second D repeat (D') to the naturally occurring ITR resulted in a sequence, designated double-D, which was sufficient to carry out the functions normally required of two wild-type irrs during a lytic AAV viral infection, i.e. it is capable of directing replication and assembly into AAV, and/or the integration into the host genome, of recombinant DNA containing the mucleic acid molecule. Vectors and viral particles containing the double-D sequence are useful in gene therapy. Replication and integration into the host genome is completely effected through the double-D sequences, ensuring that the heterologous
                                                                                                  /rpt_type= INVERTED
/label= A repeat
/note= "Forms the stem of a T-shaped structure when base
paired with A' repeat"

The patent discloses a composition comprising at least two recombinant adeno-associated viruses (rAAVs). Each rAAV contains a recombinant DNA and condecule comprising three DNA segments linked together. The first and the third DNA segments comprises 5' and 3' inverted terminal repeats (ITRs) respectively from the circular intermediate of AAV. The second DNA segment in each virus is different and does not comprise AAV sequence. It preferably comprises sequences encoding a therapeutically effective polypeptide such as the cystic fibrosis transmembrane conductance receptor gene (CTRR), the erythropoietin (epo) gene, the tyrosine hydroxylase gene (Parkinson's syndrome) or the glucocear- brosidase gene (Aducher's disease). The circular intermediate of AAV imparts increased episomal stability and persistence of the vector in the host cell. Compositions comprising TAAV sequences are useful for transferring recombinant vector is useful in medical therapy, which includes the recombinant vector is useful in medical therapy, which includes treatment or prophylaxis of blood disorders involving skeletal, cardiac or smooth muscle Adv vector is used as a delivery vehicle for gene therapy. The present sequence is the ITR DD DNA sequence referred to as "doubbe sequence". This sequence is the ITR DD DNA sequence referred to 5',478,745. This sequence is not used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition for transferring recombinant DNAs and to express a polypeptide in a host cell, comprises two recombinant adeno-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0

The present invention relates to a new method of producing a vector. The method involves introducing recombinant vector having nucleotide sequence (NS) having 5 and 3 end, left and right inverted terminal repeats of adenovirus flanking NS, adenovirus packaging sequence linked to inverted terminal repeat of adenovirus flanking S. denovirus packaging sequence linked to inverted terminal repeat linked to inverted the delicity sequences and inverted terminal vectors, especially mad vectors. The method is useful in transferring nucleotide sequences of interest into a cell, for gene transferring nucleotide sequences are useful for treating diseases associated with it, i.e. adenosine deaminase gene associated with adenosine deaminase deficiency with severe combined immune deficiency, beta-chain of the emerglobin gene associated with beta-thalassemia and sickle cell disease, receptor for low density lipoprotein gene associated with hypercholesterolaemia, hypoxanthine-guanine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        adenosine deaminase deficiency; severe combined immune deficiency; PAH; beta-chain, haemoglobin gene; beta-thalasseamia; sickle cell disease; low density lipoprotein gene; beta-thalasseamia; sickle cell disease; low density lipoprotein gene; familial hypercholesterolaemia; phenylalamine hydroxylase gene; gene therapy; phenylkenouvia; phenylalamine hydroxylase gene; gene therapy; phenylkenouvia; dystrophin gene; muscular dystrophy; cystic fibrosis; immunostimulant; human cystic fibrosis transmembrane conductance regulator gene; antianaemic; antilipaemic; nootropic; cytostatic; dermatological; human adeno-associated virus 2; AAV2; terminal repeat; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a nucleotide sequence capable of directing circular adeno-associated virus (CAAV) replication. This nucleotide sequence comprises a loop sequence (TGGCCAA) flanked on the 5' and 3' sides by complementary sequences, where a hairpin structure is formed between the complementary sequences. The CAAVS are useful in gene therapy, e.g. to treat an acute medical condition a nucleic acid encoding a therapeutic protein is inserted into the CAAV. The present sequence represents pTRT, a cAAV that contains a wild-type circularization point (the TRT domain), consisting of a single ITR flanked by two D-sequences
                                                                                                                                                                                                                                                                                                                           140
                                                                                                                                                                                                                                                                                            phosphoribosyltransferase associated with Lesch-Nyhan syndrome, hencylalanine hydroxylase (PAH) gene associated with phenylketonuria, dystrophin gene associated with muscular dystrophi, and human cystic fibrosis transmembrane conductance regulator gene associated with cystic fibrosis. The present nucleic acid sequence represents a human adeno-associated virus 2 (AAV2) terminal repeat sequence that was used in the methods of the invention
                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1, Sequence 1, Sequence 1, Sequence 1, Sequence 1, Sequence 1, Sequence 6, Sequence 8, Sequence 15, Sequence 15, Sequence 15, Sequence 11, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 6,

US-US-47-391-1

SEQUENCE 1, Application US/08475391

Patent No. 5786311

GENERAL INPOMATION:

TITLE OF INVENTION: Adeno-Associated Virus Materials and

TITLE OF INVENTION: Methods

TITLE OF INVENTION: Methods

NUMBER OF SEQUENCES: ACREASE:

ADDEESSE: Marshall, O'Toole, Gerstein, Murray & Borun

STREET: 6300 Sears Tower, 233 S. Wacker Drive

CITY: Chicago

STATE: Illinois

COUNTRY: USA

ZIP: 6066

COMPUTER READABLE FORM:

MEDIUM TYPE: FLORPY disk

COMPUTER: IBM PC Compatible

OPERATING SYSTEM: PCTOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.25

CLASSIFICATION NUMBER: US/08/475,391

FILING DATE: 07-UNN-1995

PRIOR APPLICATION DATA:

PRILICATION NUMBER: US/254,358

PRIOR APPLICATION DATA:

PRILICATION NUMBER: US/254,358
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 100.0%; Score 145; DB 1; Length 4680; Best Local Similarity 100.0%; Pred. No. 5.8e-31; Matches 145; Conservative 0; Mismatches 0; Indels 0

```
The sequence is one of two inverted terminal repeat sequences, one from parvovirus B19 and the other from adeno-associated virus 2 (AVV), used in construction of an expression vector for site specific integration and cell specific gene expression. The vector comprises at least one cassette contg. a promoter capable of effecting cell-specific expression, operably linked to a hetero-logous gene, and the cassette residing between the inverted terminal repeats. The vector is safe for use in gene therapy, partic. In treatment of haemoglobinopathies and a variety of diseases, e.g. thalassemia, diabetes, sickle cell anaemia, and cancer. See also AAQ41449. (Updated on 25-MAR-2003 to correct PN field.)

The system can specifically target primitive progenitor and differentiated cells of the erythroid lineage, and can achieve stable integration and expression of transduced genes. The vectors can be used for the in vitro or in vivo delivery of endothelial cells such as bone marrow cells, peripheral blood cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

marker gene is flanked by two strict AAV-2 ITRs, The defective viruses are useful for stably introducing large fragments of heterologous DNA making them suitable for gene therapy. (Updated on 16-OCT-2003 to standardise OS field)

The present invention relates to a new method of producing a vector. The method involves introducing recombinant vector having nucleotide sequence (NS) having 5' and 3' end, left and right inverted terminal repeats of adenovirus flanking NS, adenovirus packaging sequence linked to inverted terminal repeat, and adeno-associated virus terminal repeat linked to 3' end of NS, into cell expressing adenovirus early gene lacking from vector; and culturing cell to produce another vector. The method is useful for generating vectors, especially mAd vectors The method is useful in transferring nucleotide sequences of interest into a cell, for gene transfer applications (e.g. gene therapy) in vitro, ex vivo and in vivo. The nucleotide sequences are useful for treating diseases associated with the control of the nucleotide degree are useful for treating diseases associated with the control of the nucleotide degree of interest into diseases associated with the denosting diseases as the nucleotide degree of the associated with adenosting deaminase the control of the nucleotide degree of the nuc

```
The invention relates to a recombinant adenovirus comprising an adenovirus that encodes one or more AAV REP78/68 polypeptides that are inducibly expressed. A complete virus-mediated system for recombinant AAV production is provided which comprises: (a) a first recombinant adenovirus encoding one or more AAV REP78/68 polypeptides and one or more viral capsid polypeptides; (b) a second recombinant adenovirus comprising a gene of interest and AAV inverted terminal repeats that flank the gene of interest; (c) viral heiper functions; and (d) a host cell comprising the first recombinant adenovirus, the second recombinant adenovirus, and the viral heiper functions. The recombinant AAV is useful as a vector for gene therapy. The present sequence represents an AAV-2 left inverted terminal repeat (ITR) sequence
ITR and coding sequences for AAV VP1, VP2 and VP3 capsid proteins, for AAV non-structural replication (Rep) proteins Rep52 or Rep40, and for AAV Rep78 or Rep68. The method of producing AAV in insect cells provides an efficient, safe and economical means of producing a large amount of recombinant AAV particles which may be used in gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                    The invention relates to identifying molecules that interact with an adeno-associated viral regulatory element (e.g. a Rep recognition sequence, RRS) comprising contacting at least one molecule with a nucleic sequence, RRS) comprising on adeno-associated viral regulatory element, and identifying whether at least one molecule is bound to the viral requiatory elements. Also included is a kit for analysing the interaction between molecules and an adeno-associated viral regulatory element. The method is useful for identifying molecules e.g. at least one cellular protein, synthetic protein or exogenous protein proteins that are derived from a cDNA library or cellular lysate), or peptide, antibody, nucleic acid, lipid, carbohydrate and/or organic or inorganic compound that interacts with an adeno-associated virus (AAV) and facilitates the application of adeno-associated virus (AAV) and facilitates the application of adeno-associated virus-based vector system, therefore ITR-binding proteins and other molecules provide new insights into the AAV life cycle, including the requisition of gaseciated virus-based vector system, therefore ITR-binding proteins and other molecules provide new insights into the AAV life cycle, including the requisition of gaseciated virus-based vector system, therefore ITR-binding proteins and improvements for its application in therapy. The present sequence is an AAV-2 ITR containing an RRS used in the method of the invention
                                                                                                                                                                                                        contacting an adeno-associated viral regulatory interacting molecule with a nucleic acid comprising a adeno-associated viral regulatory element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identification of cellular regulations of adeno-associated virus involves contacting an adeno-associated viral regulatory interacting molecule with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 TTGGCCACTCCCTCTCTGCGCGCTCGCTCGCTCACTGAGGCCGGGCGACCAAAGGTCGCC 60

A novel, modified terminal repeat Structure, double-D ITR, was constructed (AAQ66769) that contained a single 145 bp ITR sequence with an additional D' sequence. The double-D ITR fragment allows profication and encapsiadation of recombinant DNA into AAV capsid proteins. Vectors including double-D ITR can be used for gene replacement therapies. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1. .165

(ITR) located at each end of its genome. In addition to being able to the see pair with each other, the ITRs can also individually fold back on themselves through the base pairing of A, A', B, B' and C, C' sequences to form a T-shaped structure for DNA replication (see features table). It has been found that viral mutants with deleted D sequences are unable to replicate their DNA. Addition of a second D repeat (D') to the naturally occurring ITR resulted in a sequence, designated double-D, which was sufficient to carry out the functions normally required of two wild-type ITRs during a lytic AAV viral infection, i.e. it is capable of directing replication and assembly into AAV, and/or the integration into the host genome, of recombinant DNA containing the nucleic acid molecule. Vectors and viral particles containing the double-D sequence are useful in gene therapy. Replication and integration into the host genome is completely effected through the double-D sequences, ensuring that the heterologous

The patent discloses a composition comprising at least two recombinant adeno-associated viruses (rAAVs). Each rAAV contains a recombinant DNA molecule comprising three DNA segments linked together. The first and the third DNA segments comprises 5' and 3' inverted terminal repeats (ITRS) respectively from the circular intermediate of AAV. The second DNA segment in each virus is different and does not comprise AAV sequence. To propagate such as the cystic fibrosis transmembrane conductance polypeptide such as the cystic fibrosis transmembrane conductance receptor gene (PRTR), the erythropoietin (epo) gene, the tyrosine receptor gene (PRTR), the erythropoietin (epo) gene, the tyrosine receptor gene (PRTR) and persistence of the vector in the host cell. Outpositions comprising rAAV sequences are useful for transferring recombinant DNAs to a host cell and express a polypeptide in a host cell are treatment or prophylaxis of blood disporders (e.g. shoth cell anaemia, than assemmia, hammorphilia), neurological disorders, such as Alzheimer's disease, Parkinson's disease, muscle disorders involving skeletal, cardiac or smooth muscle. AAV vector is used as a dalivery vehicle for gene therapy. The present sequence is used as a dalivery vehicle for as "double sequence". This sequence is the ITR DD DNA sequence referred to as "double sequence". This sequence is the present invention
Composition for transferring recombinant DNAs and to express a polypeptide in a host cell, comprises two recombinant adeno-associated viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 165 BP; 27 A; 56 C; 56 G; 26 T; 0 U; 0 Other;

The present invention relates to a new method of producing a vector. The method involves introducing recombinant vector having uncleotide sequence (NS) having 5' and, left and right inverted terminal repeats of adenovirus packaging sequence linked to inverted terminal repeats of terminal repeats of adenovirus packaging sequence linked to inverted terminal repeat linked to 3' end of NS, into cell expressing adenovirus early gene lacking from vector of and culturing cell to produce another vector. The method is useful for generating vectors, especially mAd vectors. The method is useful in transferring nucleotide sequences of interest into a cell, for gene transferring nucleotide sequences are useful for treating diseases associated with it, i.e. adenosine deaminase gene associated with adenosine deaminase (CT the mucleotide sequences are useful for treating diseases associated with asemplobin gene associated with beta-thalassemia and sickle cell to adenosibe deaminase gene associated with its ever combined immune deficiency, beta-chain of the managiopin gene associated with its ever combined immune deficiency, beta-chain of the coptor for low density lipoprotein gene associated with heach. Nyhan syndrome, the phosphoribosyltransferase associated with its everted with mescular dystrophy, and human cystic fibrosis transmembrane conductance regulator gene associated with expresents a human adenotic associated virus 2 (AAVVZ) terminal repeat sequence that was used in the
                                                                                                                                                                                                                                                                                                                 adenovirus inverted terminal repeats and packāging sequence, and adeno-
associated virus terminal repeat, into cell, and culturing cell.
                                                                                                                                                                                                                                                                                              Producing vector, by introducing vector having nucleotide sequence,

```

The specification describes a nucleotide sequence capable of directing circular adeno-associated virus (CAAV) replication. This nucleotide sequence comprises a loop sequence (TGGCAAA) finhwed on the 5' and 3' sides by complementary sequences, where a hairpin structure is formed between the complementary sequences. The CAAVs are useful in gene therapy, e.g. to treat an acute medical condition a nucleic acid encoding a therapputic protein is inserted into the cAAV. The present sequence represents pTRT, a cAAV that contains a wild-type dircularization point (the TRT domain), consisting of a single ITR flanked by two D-sequences Production of defective viral vectors for gene therapy that are completely free of helper viral vectors and helper viruses. Example 4; Page 53; 69pp; English

Sequence 165 BP; 26 A; 56 C; 56 G; 27 T; 0 U; 0 Other;

29-AUG-2002

The invention relates to methods and compositions for the construction of prokaryotic libraries expressing candidate proteins and the use of these libraries to identify candidate proteins and the nucleic acids encoding them. The invention provides a library of prokaryotic pET-24a vectors comprising a fusion nucleic acid consisting of anucleic acid encoding a nucleic acid modification (NAM) enzyme or a candidate protein, or a cuncleic acid having a T7 promoter operably linked to the NAM enzyme or the candidate protein, and an enzyme attachment sequence (EAS) recognised by the NAM enzyme. The library is used for identifying candidate proteins and nucleic acids encoding these proteins, or in screening for NAM enzymes with decreased toxicity for the host cells, or in identifying novel or improved EASs, which may be used for understanding cellular processes or improved EASs, which may be used for understanding cellular processes or any subsequent therapeutic or toxic activities. The nucleic acid/protein (NAP) conjugates are useful in diagnostic assays and in research capturicular chemicals, environmental safety assessment, chemicals, environmental safety assessment, chemicals, environmental safety assessment, chemical sensor, nutrient biology, cosmetic research or enzymelogy. These may also be used in in vitro screening techniques and in assays with target molecules. ```
The present invention relates to an isolated nuclectide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, Hi and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (bMD) and Becker muscular dystrophy (bMD) and Becker muscular dystrophy (bMD) and sector and a small polyA signal sequence
                                                                                                                                                                                                                                                                                                                                                   New dystrophin minigene for treating Duchenne or Becker muscular
dystrophy comprises an N-terminal domain or modified N-terminal domain,
rod repeats, H1 and H4 domains and a cysteine rich domain of a dystrophin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 955;

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a dystrophin

Example 1; Page 57; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

[2]), from KB or HeLa cells.

[2]), from KB or HeLa cells.

[2]) from KB or HeLa cells.

Both [1] and [2] present the opposite strand from the one presented here. The focus of both papers is the method of replication of the virus. [1] notes that the initial tt is present only 30% of the time; it is shortened to t in 50% of the population and missing altogether in 15% of the population. There is further sequence heterogeneity which can be explained by assuming that the terminal 125 bases, which form an imperfect palindrome, are replaced by their inverted complement during replication. [2] found that deletion of the 9 terminal bases on the right and the 113 terminal bases on the left of AAV 2 genome did not stop DNA replication. Further deletion of an Il-base symmetrical sequence (bases 89 to 99) in the right terminal repetition inhibits DNA replication. Substitution of either an 8-base (cagatctg) or 12-base (cagatctgc) symmetrical sequence unrelated to the original 11-base sequence restores DNA replication. All of this can be explained by assuming that the 125 base palindrome mentioned above form at t-shaped secondary structure which provides a primer for DNA polymerase during replication.
